Printing & Usage Overview

The excel multiply formula is the basic way to multiply numbers in Excel. This post shows how to use it for single cells, ranges, and simple constants. You can apply it to multiply a column by a constant or combine it with IF for conditional calculations. If your workbook uses different versions, the syntax stays the same, though some newer functions may be available. Try the shortcut Ctrl+Shift+U to see the formula in action. Multiply Cells, Ranges, and Constants with the excel multiply formula (asterisk operator usage) The excel multiply formula lets you multiply a single cell, a range, or a constant using the asterisk ( ) operator. It works the same in all Excel versions and updates instantly after pressing Enter. To multiply a column, type the formula in the top cell and drag the fill handle down. For large ranges, a dynamic array formula can avoid manual dragging. Combine the formula with IF for conditional
